Runtime API Examples

This page demonstrates usage of some of the runtime APIs provided by VitePress.

The main `useData()` API can be used to access site, theme, and page data for the current page. It works in both `.md` and `.vue` files:

```
<script setup>
import { useData } from 'vitepress'

const { theme, page, frontmatter } = useData()
</script>

## Results

### Theme Data

<pre>{{ theme }}</pre>

### Page Data

<pre>{{ page }}</pre>

### Page Frontmatter

<pre>{{ frontmatter }}</pre>
```

Results

Theme Data

```
{{ theme }}
```

Page Data

```
{{ page }}
```

Page Frontmatter

```
{{ frontmatter }}
```

More

Check out the documentation for the full list of runtime APIs.
